

Lecture 29

Review Session

Here is the Plan for Final Weeks

- ▶ This week
 - ▶ Tuesday: Last class, review session and some announcement
 - ▶ Thursday: No class, Q & A session in Room 236, Cate Center 1 during regular class time.
- ▶ Next Week
 - ▶ Tuesday: No class, Q & A session in Room 236, Cate Center 1 from 1:30pm - 2:30pm.
 - ▶ Wednesday 12:30pm - 6:30pm, window for the optional final exam.

Clarification on Optional Final Exam

It is truly optional!

- ▶ Calculate your grades in the following manner:
 - ▶ Take the arithmetic mean of your highest 15 out of the 18 assignments.
 - ▶ For assignment with technical issues, make sure confirm with me through email about excluding it.
 - ▶ For assignments with technical issues, you can calculate the grade by taking the arithmetic mean of your highest $15 - x$ out of the $18 - x$ assignments, where x is number of assignments with issues (that you have confirmed with me).

Clarification on Optional Final Exam

Take the optional final if

- ▶ You are not happy with the current cumulative grade.
- ▶ You are interested in taking it.
- ▶ In the end, I will take the higher one between your assignments average and optional final.

About the Optional Final Exam Format

- ▶ It will be given between 12:30pm - 6:30pm on December 11th, which is next Wednesday.
- ▶ It has 30-35 T/F and multiple choices questions.
- ▶ You have 100 minutes to complete it.
- ▶ Covers material until multiple linear regression.
- ▶ You can start at any time between 12:30pm - 4:50pm, after 4:50pm might be too late.
- ▶ Open book exam, it is similar to the quizzes except the length.

Curve and Attendance Policy

Curving

- ▶ As mentioned in syllabus, I will curve the median grade to 90 if it is below 90.
- ▶ I will do the curving by moving the bell shape grade distribution toward right.

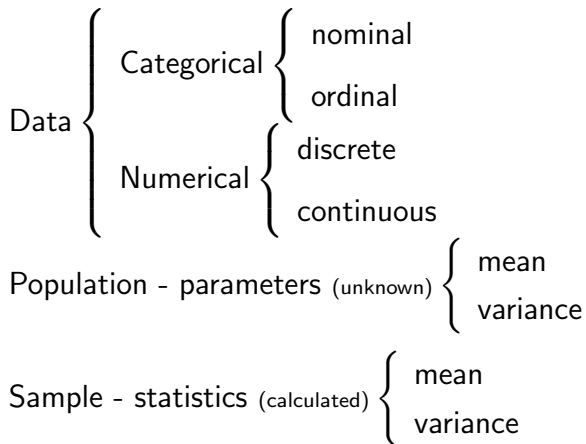

Attendance

- ▶ I won't deduct your marks for missing classes.
- ▶ I will add marks in calculating letter grades for those show up in classes.

The Course Reflection Survey

- ▶ I'd like to ask you to do me a favor. If possible, could you please help me with the Course Reflection Survey? It is due by this Sunday.
- ▶ Then I will know where I should improve.
- ▶ Thank you!

Data Types and Statistics

Hypothesis Testing

- ▶ Define your null (H_0) and alternative (H_1) hypotheses.
- ▶ Calculate an appropriate test statistic.
- ▶ Based on the sampling distribution of the test statistic under H_0 , reject H_0 if the observed test statistic is extreme (using rejection regions or p -values).
- ▶ Reject H_0 if your test statistic falls in the rejection region or if your p -value is less than α .

Single Population

- ▶ Testing μ when σ^2 known:
 - ▶ Calculate Z -statistic.
 - ▶ Compare to $N(0, 1)$ distribution.
 - ▶ One or two-tailed depending on H_1 .
- ▶ Testing μ when σ^2 unknown:
 - ▶ Calculate T -statistic.
 - ▶ Compare to t -distribution with $n - 1$ degrees of freedom.
 - ▶ One or two-tailed depending on H_1 .
- ▶ Testing a population proportion p :
 - ▶ Calculate Z -statistic.
 - ▶ Compare to $N(0, 1)$ distribution.
 - ▶ One or two-tailed depending on H_1 .

Comparing Two Populations

Independent Samples

- ▶ Testing $\mu_1 - \mu_2$ when σ_1^2, σ_2^2 known:
 - ▶ Calculate Z -statistic.
 - ▶ Compare to $N(0, 1)$ distribution.
 - ▶ One or two-tailed depending on H_1 .
- ▶ Testing $\mu_1 - \mu_2$ when σ_1^2, σ_2^2 unknown and $\sigma_1^2 = \sigma_2^2$:
 - ▶ Calculate pooled sample variance s_p^2 .
 - ▶ Calculate T -statistic.
 - ▶ Compare to t -distribution with $n_1 + n_2 - 2$ degrees of freedom.
 - ▶ One or two-tailed depending on H_1 .

Comparing Two Populations

Independent Samples

- ▶ Testing $H_0 : \sigma_1^2 = \sigma_2^2$ vs $H_1 : \sigma_1^2 \neq \sigma_2^2$:
 - ▶ Calculate F -statistic (put larger sample variance on top).
 - ▶ Compare to F -distribution with $n_1 - 1$ numerator degrees of freedom and $n_2 - 1$ denominator degrees of freedom (n_1 is the sample size corresponding to the larger sample variance).
 - ▶ Two-tailed, but only need to look at upper tail of F -distribution.

Comparing Two Populations

Paired Samples

- ▶ Testing μ_D :
 - ▶ Calculate paired differences (remember to set up hypotheses appropriately).
 - ▶ Calculate T -statistic.
 - ▶ Compare to t -distribution with $n - 1$ degrees of freedom.
 - ▶ One or two-tailed depending on H_1 .

Comparing Two Populations

- ▶ Testing $H_0 : p_1 - p_2 = D_0$ for $D_0 \neq 0$:
 - ▶ Calculate Z -statistic.
 - ▶ Compare to $N(0, 1)$ distribution.
 - ▶ One or two-tailed depending on H_1 .
- ▶ Testing $H_0 : p_1 - p_2 = 0$:
 - ▶ Calculate combined proportion \hat{p} .
 - ▶ Calculate Z -statistic.
 - ▶ Compare to $N(0, 1)$ distribution.
 - ▶ One or two-tailed depending on H_1 .

ANOVA

- ▶ Calculate sums of squares, degrees of freedom and mean squares for each source of variation.
- ▶ Calculate F -statistic.
- ▶ Compare to F -distribution with numerator degrees of freedom equal to the factor or interaction degrees of freedom, and denominator degrees of freedom equal to the error degrees of freedom.
- ▶ One-tailed, reject when F -statistic is too large.

Simple Linear Regression

- ▶ Testing overall significance of model:
 - ▶ That is, testing $H_0 : \beta_1 = 0$ vs $H_1 : \beta_1 \neq 0$.
 - ▶ Calculate T -statistic.
 - ▶ Compare to t -distribution with $n - 2$ degrees of freedom.
 - ▶ Two-tailed.
 - ▶ Can also test overall significance of model by testing $H_0 : \rho = 0$ vs $H_1 : \rho \neq 0$.

Simple Linear Regression

- ▶ General tests for β_0 and β_1 :
 - ▶ Calculate T -statistic.
 - ▶ Compare to t -distribution with $n - 2$ degrees of freedom.
 - ▶ One or two-tailed depending on H_1 .
 - ▶ May not be able to use p -value given in computer output, since this is the p -value for testing $H_0 : \beta_j = 0$ vs $H_1 : \beta_j \neq 0$, for $j = 0, 1$.

Multiple Linear Regression

- ▶ Testing overall significance of model:
 - ▶ Calculate sums of squares, degrees of freedom and mean squares.
 - ▶ Calculate F -statistic.
 - ▶ Compare to F -distribution with k numerator degrees of freedom and $n - k - 1$ denominator degrees of freedom, where k is the number of independent variables in the model.
 - ▶ One-tailed, reject when F -statistic is too large.

Multiple Linear Regression

- ▶ Testing individual coefficient parameters:
 - ▶ Calculate T -statistic.
 - ▶ Compare to t -distribution with $n - k - 1$ degrees of freedom.
 - ▶ One or two-tailed depending on H_1 .
 - ▶ Note that the p -value given in the computer output is for testing $H_0 : \beta_j = 0$ vs $H_1 : \beta_j \neq 0$, for $j = 0, \dots, k$.
 - ▶ The conclusion of each individual test is conditional on the fact that the other independent variables have already been included in the model.

Using Probability Tables

- ▶ Binomial tables:

- ▶ Can only use the binomial tables if the required values of n and p are listed in the table.
- ▶ For values of n and p which are not in the table, you must use the binomial formula.

- ▶ Normal tables:

- ▶ When looking up a Z -value to find the corresponding probability, round the Z -value to 2 decimal places.
- ▶ When looking up a probability to find the corresponding Z -value, choose the closest probability.
- ▶ When probability falls exactly in the middle between two Z -values, choose mid-point (e.g., $z_{0.05} = 1.645$).

Using Probability Tables

- ▶ t -table:
 - ▶ To find a lower critical value, put a negative on the corresponding upper critical value.
- ▶ F -tables:
 - ▶ Remember to use the correct F -table corresponding to the value of α .
- ▶ t -table and F -tables:
 - ▶ If you can't find the exact degree of freedom in the table, chose the closest degree of freedom.
